

GARDEN THERMOMETER

1. Mounting

The assembly rods can be screwed together according to the requested length. Please push all garden thermometers into the ground carefully, avoiding to use force, as otherwise the rods could get bent. If required, pre-drill a hole into the ground.

2. Top part

With most models, the angle of inclination of the top part can be adjusted and thus be brought into the desired position.

3. Calibration

GARDEN DISC Thermometers are calibrated at the factory. The thermometer can be easily re-calibrated if necessary. Using a pointed object, such as a screw driver, simply turn the adjustment device as shown in the diagram on the left side.

Attention: Metal parts can become very hot if exposed to direct sun light. Furthermore, direct solar radiation may lead to incorrect and/or higher temperature values.
